

Viator booking access Affiliate API - back-end checks

How to get started

1. Please read carefully this article about [Managing product and availability data](#) before submitting answers.
2. Please fill in your answers to the form below.
3. Send this document back to us at affiliateapi@tripadvisor.com.
4. We will verify your integration and ensure everything is in working order.
5. We will reach out directly to you via email with additional questions or to let you know you've completed the back-end checks.
6. Only after back-end checks are approved, additional API access will be enabled.

Note: Your endpoint usage plan is required for certification and must be detailed in specificity. Once approved by our team, any changes to this plan must be discussed with us in advance.

General questions

1. What is your company name?

Your response:	TripVega
----------------	----------

2. Is this a B2B or B2C implementation, or both?

Your response:	B2C - Direct to consumer travel booking platform
----------------	--

3. Is this implementation for desktop, mobile, or app?

Your response:	Desktop and Mobile (Responsive Web Application). No native app at this time.
----------------	--

4. How many destinations do you support? Which destinations do you exclude, if any, and why?

Your response:	We support all destinations available through the Viator API. No destinations are currently excluded.
----------------	--

5. How many products do you support? If you filter out some products, what criteria is it based on? Are you going to add more products post launch?

Your response:	We plan to support all products available through the Viator API (full catalog). No products are filtered out - we ingest all destinations and products available on Viator. New products are automatically added via the hourly /products/modified-since delta updates.
----------------	--

Endpoint usage

6. Please tell us which endpoints are used in your implementation. For the endpoints used, please indicate whether they are used for ingestion or in real-time, as well as how often you're going to call them.

Please refer to this section of the API documentation: [Update frequency](#).

For example, if you ingest all data with `/products/modified-since` every 30 minutes, the input in the table should look like this:

Endpoint	Ingestion	Real-time	Additional notes
/products/modified-since	-	-	-

Please provide this information in the table below for all endpoints that are used:

Endpoint	Ingestion	Real-time	Additional notes
/products/modified-since	Hourly	-	Full product content ingestion, using cursor parameter
/products/bulk	-	-	Only for edge cases (max a few products at a time)
/products/{product-code}	-	-	Not used (data from ingestion)
/availability/schedules/modified-since	Hourly	-	Availability & pricing schedules, using cursor parameter
/availability/schedules/bulk	-	-	Only for edge cases
/availability/schedules/{product-code}	-	-	Not used (data from ingestion)

/products/search	-	-	Not used (search from own DB)
/search/freetext	-	-	Not used (search from own DB)
/products/tags	Weekly	-	Cached
/products/booking-questions	Monthly	-	Cached
/locations/bulk	Monthly	-	Cached + on-demand for new locations
/exchange-rates	Daily	-	Based on expiry timestamp
/reviews/product	Weekly	-	Cached, provider indicated
/suppliers/search/product-codes	Weekly	-	Cached
/destinations	Weekly	-	Cached
/attractions/search	Weekly	-	Cached
/attractions/{attraction-id}	Weekly	-	Cached
/availability/check	-	Yes	When user selects date/pax + before booking
/bookings/cart/hold	-	Yes	Before payment details
/bookings/cart/book	-	Yes	At checkout
/v1/checkoutsessions/{sessionToken}/paymentaccounts	-	Yes	For payment processing
/bookings/status	-	Yes	For pending booking (hourly)
/bookings/modified-since	Every 3 min	-	For supplier cancellations
/bookings/modified-since/acknowledge	-	-	Not applicable
/bookings/cancel-reasons	Monthly	-	Cached

/bookings/{booking-reference}/cancel-quote	-	Yes	Before cancellation
/bookings/{booking-reference}/cancel	-	Yes	User-initiated cancellation

* Real-time availability may not be requested unless the user has selected a travel date and passenger mix based on [Viator age bands](#) returned for the product. This endpoint must not be used for ingestion of availability/ pricing data.

** If you decide to display the reviews or review rating from the API, it's a legal requirement to indicate the provider of the reviews (Viator/Tripadvisor). The provider must be correctly specified, for example, it's not correct to say that all reviews are sourced from Tripadvisor if some of them are Viator reviews.

Product search

7. Do you provide search results to customers that are returned by our **search endpoint** or do you return search results **directly from your database**?

Your response:	Search results are returned directly from our database (Supabase). Product data is ingested via /products/modified-since at least hourly (as per Viator requirements). We do NOT use /products/search or /products/{product-code} in real-time.
----------------	---

8. If you're using the search endpoint(s), can you confirm that the **pagination** has been applied in your implementation and you're not requesting more than 50 products at a time, and making additional requests only when the customer wants to see more products?

Please note: You should paginate through the search results (using the start and the count paremeters) only when the customer wants to move to the next page with search results to see more products.

Your response:	N/A. We do not use the Viator search endpoints. Search is performed against our local database (Ingestion Model).
----------------	--

Attractions

9. Do you use attraction data from the API? If so, could you confirm that it's not indexed?

Please note: Guidelines to prevent indexing of unique content can be found [here](#).

Your response:	Yes, we use attraction data from the API.
----------------	---

	Confirmed: Attraction pages include noindex meta tags to prevent search engine indexing.
--	--

Reviews

10. Do you display Viator or Tripadvisor reviews from the API? If so, could you confirm that this data is not indexed?

Please note: Guidelines to prevent indexing of unique content can be found [here](#).

Your response:	Yes, we display reviews from the API. Confirmed: Review content is not indexed (noindex meta tags applied). Reviews are cached and refreshed weekly.
----------------	--

11. If the reviews or review scoring from the API are used on your site, do you indicate the provider of the reviews (Viator/Tripadvisor)?

Please note: It is a legal requirement to indicate the provider of the reviews (Viator/Tripadvisor) even if only the review rating is displayed without the review text. You can use the same text as on the Viator website: "Total review count and overall rating based on Viator and Tripadvisor reviews". Refer to contractual agreement on requirements to indicate source of reviews.

Your response:	Yes, we indicate the provider of reviews. We display: "Total review count and overall rating based on Viator and Tripadvisor reviews" The correct provider (Viator/Tripadvisor) is specified for each review.
----------------	---

Exchange rates

12. Do you use the Viator exchange rates from the [/exchange-rates](#) endpoint? If so, can you confirm that the exchange rates are cached and refreshed following the expiry timestamp from the response?

Please note: If you're using any of the /schedules endpoints to get the pricing schedules, you will need to convert the pricing into the currency of the booking as /schedules endpoints return the price in the supplier's currency. It's not mandatory for you to apply Viator's exchange rates (we recommend using Viator's exchange rates for conversion as you will be invoiced based on the Viator's rates). However if you use the [/exchange-rates](#) endpoint this data must be cached and refreshed based on the expiry timestamp.

Merchant Partners Only

You will be invoiced **partnerTotalPrice** based on the Viator exchange rates in the currency sent in the booking request (you can choose between the following currencies: AUD, CAD, EUR, GBP, USD).

Your response:	Yes, we use Viator exchange rates from /exchange-rates. Exchange rates are cached and refreshed based on the expiry timestamp from the response (currently once per day).
----------------	--

	We use EUR as our primary booking currency.
--	---

Locations

13. Do you have access to Google Places API to retrieve details of Google locations using the providerReference from the [/locations/bulk](#) response?

Please note: in accordance with our contractual agreement with Google, we are unable to share location details for Google locations. To access this data, you will need to have your own account and utilize the Google Places API.

Your response:	No, we do not currently have Google Places API access. We will only use Viator-provided location data.
----------------	--

Real-time availability and pricing

14. Do you conduct availability and pricing checks in real-time prior to booking? If so, at what stage of the booking flow and what endpoint do you use for this?

Your response:	Yes, we conduct real-time availability and pricing checks using /availability/check at two stages: 1. When the customer selects a date and passenger mix (age bands) 2. Immediately before submitting the booking request to verify current price/availability This workflow follows Viator's best practice recommendation to minimize the possibility of customers finding items unavailable at checkout.
----------------	---

15. Can you confirm that the [/availability/check](#) endpoint is used when a specific date and passenger mix (age bands) are selected?

Your response:	Confirmed. The /availability/check endpoint is called only after: - User has selected a specific travel date - User has selected passenger mix based on Viator age bands returned for the product This endpoint is NOT used for ingesting availability/pricing data.
----------------	---

16. In case of pricing differences between previously quoted price and the new price from the [/availability/check](#) response, do you apply the new price?

Your response:	Yes. If the /availability/check response returns a different price than previously quoted: 1. We apply the NEW price to the booking 2. We clearly communicate the price change to the customer before proceeding 3. The booking flow is NOT automatically canceled - the customer decides whether to proceed
----------------	---

Timeout

17. Have you implemented a timeout for API services on your end? If so, how long is it?

Please note: the timeout for all API services should be 120s.

Your response:	Yes, we have implemented a 120 second timeout for all Viator API services, as recommended.
----------------	--
